# REVIEW

A recursive definition of a sequence specifies

- Initial conditions
- Recurrence relation

Example:

# LINEAR RECURRENCES

Linear recurrence:

Each term of a sequence is a linear function of earlier terms in the sequence.

For example:

$$a_0 = 1 \qquad a_1 = 6 \qquad a_2 = 10$$

$$a_n = a_{n-1} + 2a_{n-2} + 3a_{n-3}$$

$$\begin{aligned} a_3 &= a_0 + 2a_1 + 3a_2 \\ &= 1 + 2(6) + 3(10) = 43 \end{aligned}$$

# LINEAR RECURRENCES

Linear recurrences

1. Linear homogeneous recurrences
2. Linear non-homogeneous recurrences

# LINEAR HOMOGENEOUS RECURRENCES

A **linear homogenous recurrence relation of degree k** with constant coefficients is a recurrence relation of the form

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k},$$

where  $c_1, c_2, \dots, c_k$  are real numbers, and  $c_k \neq 0$ .

$a_n$  is expressed in terms of the previous  $k$  terms of the sequence, so its degree is  $k$ .

This recurrence includes  $k$  initial conditions.

$$a_0 = C_0 \qquad a_1 = C_1 \qquad \dots \qquad a_k = C_k$$

# EXAMPLE

Determine if the following recurrence relations are linear homogeneous recurrence relations with constant coefficients.

- $P_n = (1.11)P_{n-1}$   
a linear homogeneous recurrence relation of degree one
- $a_n = a_{n-1} + a_{n-2}^2$   
not linear
- $f_n = f_{n-1} + f_{n-2}$   
a linear homogeneous recurrence relation of degree two
- $H_n = 2H_{n-1} + 1$   
not homogeneous
- $a_n = a_{n-6}$   
a linear homogeneous recurrence relation of degree six
- $B_n = nB_{n-1}$   
does not have constant coefficient

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

- **Proposition 1:**
  - Let  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$  be a linear homogeneous recurrence.
  - Assume the sequence  $a_n$  satisfies the recurrence.
  - Assume the sequence  $a'_n$  also satisfies the recurrence.
  - So,  $b_n = a_n + a'_n$  and  $d_n = \alpha a_n$  are also sequences that satisfy the recurrence.
    - ( $\alpha$  is any constant)
- **Proof:**
  - $b_n = a_n + a'_n$
  - $= (c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}) + (c_1 a'_{n-1} + c_2 a'_{n-2} + \dots + c_k a'_{n-k})$
  - $= c_1 (a_{n-1} + a'_{n-1}) + c_2 (a_{n-2} + a'_{n-2}) + \dots + c_k (a_{n-k} + a'_{n-k})$
  - $= c_1 b_{n-1} + c_2 b_{n-2} + \dots + c_k b_{n-k}$
  - So,  $b_n$  is a solution of the recurrence.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

- **Proposition 1:**
  - Let  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$  be a linear homogeneous recurrence.
  - Assume the sequence  $a_n$  satisfies the recurrence.
  - Assume the sequence  $a'_n$  also satisfies the recurrence.
  - So,  $b_n = a_n + a'_n$  and  $d_n = \alpha a_n$  are also sequences that satisfy the recurrence.
    - ( $\alpha$  is any constant)
- **Proof:**
  - $d_n = \alpha a_n$
  - $= \alpha (c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k})$
  - $= c_1 (\alpha a_{n-1}) + c_2 (\alpha a_{n-2}) + \dots + c_k (\alpha a_{n-k})$
  - $= c_1 d_{n-1} + c_2 d_{n-2} + \dots + c_k d_{n-k}$
  - So,  $d_n$  is a solution of the recurrence.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

- It follows from the previous proposition, if we find some solutions to a linear homogeneous recurrence, then **any linear combination** of them will also be a solution to the linear homogeneous recurrence.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

Geometric sequences come up a lot when solving linear homogeneous recurrences.

So, try to find any solution of the form  $a^n = r^n$  that satisfies the recurrence relation.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

- Recurrence relation

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

- Try to find a solution of form  $r^n$

$$r^n = c_1 r^{n-1} + c_2 r^{n-2} + \dots + c_k r^{n-k}$$

$$r^n - c_1 r^{n-1} - c_2 r^{n-2} - \dots - c_k r^{n-k} = 0$$

$$r^k - c_1 r^{k-1} - c_2 r^{k-2} - \dots - c_k = 0 \quad (\text{dividing both sides by } r^{n-k})$$

This equation is called the **characteristic equation**.

## EXAMPLE

Example:

The Fibonacci recurrence is

$$F_n = F_{n-1} + F_{n-2}$$

Its characteristic equation is

$$r^2 - r - 1 = 0$$

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

## Proposition 2:

$r$  is a solution of  $r^k - c_1 r^{k-1} - c_2 r^{k-2} - \dots - c_k = 0$  if and only if  $r^n$  is a solution of  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$ .

## Example:

consider the characteristic equation  $r^2 - 4r + 4 = 0$ .

$$r^2 - 4r + 4 = (r - 2)^2 = 0$$

So,  $r=2$ .

So,  $2^n$  satisfies the recurrence  $F_n = 4F_{n-1} - 4F_{n-2}$ .

$$2^n = 4 \cdot 2^{n-1} - 4 \cdot 2^{n-2}$$

$$2^{n-2} (4 - 8 + 4) = 0$$

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

## Theorem 1:

- Consider the characteristic equation  $r^k - c_1 r^{k-1} - c_2 r^{k-2} - \dots - c_k = 0$  and the recurrence  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$ .
- Assume  $r_1, r_2, \dots$  and  $r_m$  all satisfy the equation.
- Let  $\alpha_1, \alpha_2, \dots, \alpha_m$  be any constants.
- So,  $a_n = \alpha_1 r_1^n + \alpha_2 r_2^n + \dots + \alpha_m r_m^n$  satisfies the recurrence.

## Proof:

By Proposition 2,  $\therefore \exists r_i^n$  satisfies the recurrence.

So, by Proposition 1,  $\therefore \exists \alpha_i r_i^n$  satisfies the recurrence.

Applying Proposition 1 again, the sequence  $a_n = \alpha_1 r_1^n + \alpha_2 r_2^n + \dots + \alpha_m r_m^n$  satisfies the recurrence.

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = a_{n-1} + 2a_{n-2}$$

with  $a_0=2$  and  $a_1=7$ ?

**Solution:**

- Since it is linear homogeneous recurrence, first find its characteristic equation

$$r^2 - r - 2 = 0$$

$$(r+1)(r-2) = 0 \quad r_1 = 2 \text{ and } r_2 = -1$$

- So, by theorem  $a_n = \alpha_1 2^n + \alpha_2 (-1)^n$  is a solution.
- Now we should find  $\alpha_1$  and  $\alpha_2$  using initial conditions.

$$a_0 = \alpha_1 + \alpha_2 = 2$$

$$a_1 = \alpha_1 2 + \alpha_2 (-1) = 7$$

- So,  $\alpha_1 = 3$  and  $\alpha_2 = -1$ .
- $a_n = 3 \cdot 2^n - (-1)^n$  is a solution.

# EXAMPLE

What is the solution of the recurrence relation

$$f_n = f_{n-1} + f_{n-2}$$

with  $f_0=0$  and  $f_1=1$ ?

**Solution:**

- Since it is linear homogeneous recurrence, first find its characteristic equation

$$r^2 - r - 1 = 0$$

$$r_1 = (1+\sqrt{5})/2 \text{ and } r_2 = (1-\sqrt{5})/2$$

- So, by theorem  $f_n = \alpha_1((1+\sqrt{5})/2)^n + \alpha_2((1-\sqrt{5})/2)^n$  is a solution.
- Now we should find  $\alpha_1$  and  $\alpha_2$  using initial conditions.

$$f_0 = \alpha_1 + \alpha_2 = 0$$

$$f_1 = \alpha_1(1+\sqrt{5})/2 + \alpha_2(1-\sqrt{5})/2 = 1$$

- So,  $\alpha_1 = 1/\sqrt{5}$  and  $\alpha_2 = -1/\sqrt{5}$ .
- $a_n = 1/\sqrt{5} \cdot ((1+\sqrt{5})/2)^n - 1/\sqrt{5}((1-\sqrt{5})/2)^n$  is a solution.

# EXAMPLE

What is the solution of the recurrence relation

$$a_n = -a_{n-1} + 4a_{n-2} + 4a_{n-3}$$

with  $a_0=8$ ,  $a_1=6$  and  $a_2=26$ ?

**Solution:**

- Since it is linear homogeneous recurrence, first find its characteristic equation

$$r^3 + r^2 - 4r - 4 = 0$$

$$(r+1)(r+2)(r-2) = 0$$

$$r_1 = -1, r_2 = -2 \text{ and } r_3 = 2$$

- So, by theorem  $a_n = \alpha_1(-1)^n + \alpha_2(-2)^n + \alpha_3 2^n$  is a solution.
- Now we should find  $\alpha_1$ ,  $\alpha_2$  and  $\alpha_3$  using initial conditions.

$$a_0 = \alpha_1 + \alpha_2 + \alpha_3 = 8$$

$$a_1 = -\alpha_1 - 2\alpha_2 + 2\alpha_3 = 6$$

$$a_2 = \alpha_1 + 4\alpha_2 + 4\alpha_3 = 26$$

- So,  $\alpha_1 = 2$ ,  $\alpha_2 = 1$  and  $\alpha_3 = 5$ .
- $a_n = 2 \cdot (-1)^n + (-2)^n + 5 \cdot 2^n$  is a solution.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

If the characteristic equation has  $k$  distinct solutions  $r_1, r_2, \dots, r_k$ , it can be written as

$$(r - r_1)(r - r_2)\dots(r - r_k) = 0.$$

If, after factoring, the equation has  $m+1$  factors of  $(r - r_1)$ , for example,  $r_1$  is called a solution of the characteristic equation with multiplicity  $m+1$ .

When this happens, not only  $r_1^n$  is a solution, but also  $nr_1^n, n^2r_1^n, \dots$  and  $n^mr_1^n$  are solutions of the recurrence.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

## Proposition 3:

- Assume  $r_0$  is a solution of the characteristic equation with multiplicity at least  $m+1$ .
- So,  $n^m r_0^n$  is a solution to the recurrence.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

When a characteristic equation has fewer than  $k$  distinct solutions:

- We obtain sequences of the form described in Proposition 3.
- By Proposition 1, we know any combination of these solutions is also a solution to the recurrence.
- We can find those that satisfies the initial conditions.

# SOLVING LINEAR HOMOGENEOUS RECURRENCES

## Theorem 2:

- Consider the characteristic equation  $r^k - c_1 r^{k-1} - c_2 r^{k-2} - \dots - c_k = 0$  and the recurrence  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$ .
- Assume the characteristic equation has  $t$   $s_k$  distinct solutions.
- Let  $\zeta_i$  ( $1 \leq i \leq t$ )  $r_i$  with multiplicity  $m_i$  be a solution of the equation.
- Let  $\alpha_{ij}$  ( $1 \leq i \leq t$  and  $0 \leq j \leq m_i - 1$ ) be a constant.
- So,  $a_n = (\alpha_{10} + \alpha_{11} n + \dots + \alpha_{1, m_1 - 1} n^{m_1 - 1}) r_1^n$   
 $+ (\alpha_{20} + \alpha_{21} n + \dots + \alpha_{2, m_2 - 1} n^{m_2 - 1}) r_2^n$   
 $+ \dots$   
 $+ (\alpha_{t0} + \alpha_{t1} n + \dots + \alpha_{t, m_t - 1} n^{m_t - 1}) r_t^n$   
 satisfies the recurrence.

# EXAMPLE

What is the solution of the recurrence relation

$$a_n = 6a_{n-1} - 9a_{n-2}$$

with  $a_0=1$  and  $a_1=6$ ?

**Solution:**

- First find its characteristic equation

$$r^2 - 6r + 9 = 0$$

$$(r - 3)^2 = 0 \quad r_1 = 3 \quad (\text{Its multiplicity is 2.})$$

- So, by theorem  $a_n = (\alpha_{10} + \alpha_{11}n)(3)^n$  is a solution.
- Now we should find constants using initial conditions.

$$a_0 = \alpha_{10} = 1$$

$$a_1 = 3\alpha_{10} + 3\alpha_{11} = 6$$

- So,  $\alpha_{11} = 1$  and  $\alpha_{10} = 1$ .
- $a_n = 3^n + n3^n$  is a solution.

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = -3a_{n-1} - 3a_{n-2} - a_{n-3}$$

with  $a_0=1$ ,  $a_1=-2$  and  $a_2=-1$ ?

**Solution:**

- Find its characteristic equation

$$r^3 + 3r^2 + 3r + 1 = 0$$

$$(r + 1)^3 = 0 \quad r_1 = -1 \quad (\text{Its multiplicity is 3.})$$

- So, by theorem  $a_n = (\alpha_{10} + \alpha_{11}n + \alpha_{12}n^2)(-1)^n$  is a solution.
- Now we should find constants using initial conditions.

$$a_0 = \alpha_{10} = 1$$

$$a_1 = -\alpha_{10} - \alpha_{11} - \alpha_{12} = -2$$

$$a_2 = \alpha_{10} + 2\alpha_{11} + 4\alpha_{12} = -1$$

- So,  $\alpha_{10}=1$ ,  $\alpha_{11}=3$  and  $\alpha_{12}=-2$ .
- $a_n = (1 + 3n - 2n^2)(-1)^n$  is a solution.

# EXAMPLE

What is the solution of the recurrence relation

$$a_n = 8a_{n-2} - 16a_{n-4}, \text{ for } n \geq 4,$$

with  $a_0=1$ ,  $a_1=4$ ,  $a_2=28$  and  $a_3=32$ ?

**Solution:**

- Find its characteristic equation

$$r^4 - 8r^2 + 16 = 0$$

$$(r^2 - 4)^2 = (r-2)^2 (r+2)^2 = 0$$

$$r_1 = 2 \quad r_2 = -2 \quad (\text{Their multiplicities are 2.})$$

- So, by theorem  $a_n = (\alpha_{10} + \alpha_{11}n)(2)^n + (\alpha_{20} + \alpha_{21}n)(-2)^n$  is a solution.
- Now we should find constants using initial conditions.

$$a_0 = \alpha_{10} + \alpha_{20} = 1$$

$$a_1 = 2\alpha_{10} + 2\alpha_{11} - 2\alpha_{20} - 2\alpha_{21} = 4$$

$$a_2 = 4\alpha_{10} + 8\alpha_{11} + 4\alpha_{20} + 8\alpha_{21} = 28$$

$$a_3 = 8\alpha_{10} + 24\alpha_{11} - 8\alpha_{20} - 24\alpha_{21} = 32$$

- So,  $\alpha_{10}=1$ ,  $\alpha_{11}=2$ ,  $\alpha_{20}=0$  and  $\alpha_{21}=1$ .
- $a_n = (1 + 2n) 2^n + n (-2)^n$  is a solution.

# LINEAR NON-HOMOGENEOUS RECURRENCES

A **linear non-homogenous recurrence relation** with constant coefficients is a recurrence relation of the form

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + f(n),$$

where  $c_1, c_2, \dots, c_k$  are real numbers, and  $f(n)$  is a function depending only on  $n$ .

The recurrence relation

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k},$$

is called the **associated homogeneous recurrence relation**.

This recurrence includes  $k$  initial conditions.

$$a_0 = C_0 \qquad a_1 = C_1 \quad \dots \qquad a_k = C_k$$

# EXAMPLE

The following recurrence relations are linear non-homogeneous recurrence relations.

□  $a_n = a_{n-1} + 2^n$

□  $a_n = a_{n-1} + a_{n-2} + n^2 + n + 1$

□  $a_n = a_{n-1} + a_{n-4} + n!$

□  $a_n = a_{n-6} + n2^n$

# LINEAR NON-HOMOGENEOUS RECURRENCES

## Proposition 4:

- Let  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + f(n)$  be a linear non-homogeneous recurrence.
- Assume the sequence  $b_n$  satisfies the recurrence.
- Another sequence  $a_n$  satisfies the non-homogeneous recurrence if and only if  $h_n = a_n - b_n$  is also a sequence that satisfies the associated homogeneous recurrence.

# LINEAR NON-HOMOGENEOUS RECURRENCES

**Proof:**

Part1: if  $h_n$  satisfies the associated homogeneous recurrence  
then  $a_n$  is satisfies the non-homogeneous recurrence.

$$\blacksquare \quad b_n = c_1 b_{n-1} + c_2 b_{n-2} + \dots + c_k b_{n-k} + f(n)$$

$$\blacksquare \quad h_n = c_1 h_{n-1} + c_2 h_{n-2} + \dots + c_k h_{n-k}$$

$$b_n + h_n$$

$$= c_1 (b_{n-1} + h_{n-1}) + c_2 (b_{n-2} + h_{n-2}) + \dots + c_k (b_{n-k} + h_{n-k}) + f(n)$$

Since  $a_n = b_n + h_n$ ,  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + f(n)$ .

So,  $a_n$  is a solution of the non-homogeneous recurrence.

# LINEAR NON-HOMOGENEOUS RECURRENCES

Proof:

Part2: if  $a_n$  satisfies the non-homogeneous recurrence then  $h_n$  is satisfies the associated homogeneous recurrence.

$$\blacksquare \quad b_n = c_1 b_{n-1} + c_2 b_{n-2} + \dots + c_k b_{n-k} + f(n)$$

$$\blacksquare \quad a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + f(n)$$

$$a_n - b_n$$

$$= c_1 (a_{n-1} - b_{n-1}) + c_2 (a_{n-2} - b_{n-2}) + \dots + c_k (a_{n-k} - b_{n-k})$$

$$\text{Since } h_n = a_n - b_n, \quad h_n = c_1 h_{n-1} + c_2 h_{n-2} + \dots + c_k h_{n-k}$$

So,  $h_n$  is a solution of the associated homogeneous recurrence.

# LINEAR NON-HOMOGENEOUS RECURRENCES

## Proposition 4:

- Let  $a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k} + f(n)$  be a linear non-homogeneous recurrence.
  - Assume the sequence  $b_n$  satisfies the recurrence.
  - Another sequence  $a_n$  satisfies the non-homogeneous recurrence if and only if  $h_n = a_n - b_n$  is also a sequence that satisfies the associated homogeneous recurrence.
- 
- We already know how to find  $h_n$ .
  - For many common  $f(n)$ , a solution  $b_n$  to the non-homogeneous recurrence is similar to  $f(n)$ .
  - Then you should find solution  $a_n = b_n + h_n$  to the non-homogeneous recurrence that satisfies both recurrence and initial conditions.

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = a_{n-1} + a_{n-2} + 3n + 1 \text{ for } n \geq 2,$$

with  $a_0=2$  and  $a_1=3$ ?

**Solution:**

- Since it is linear non-homogeneous recurrence,  $b_n$  is similar to  $f(n)$

Guess:  $b_n = cn + d$

$$b_n = b_{n-1} + b_{n-2} + 3n + 1$$

$$cn + d = c(n-1) + d + c(n-2) + d + 3n + 1$$

$$cn + d = cn - c + d + cn - 2c + d + 3n + 1$$

$$0 = (3+c)n + (d-3c+1)$$

$$c = -3 \quad d = -10$$

- So,  $b_n = -3n - 10$ .

( $b_n$  only satisfies the recurrence, it does not satisfy the initial conditions.)

# EXAMPLE

What is the solution of the recurrence relation

$$a_n = a_{n-1} + a_{n-2} + 3n + 1 \text{ for } n \geq 2,$$

with  $a_0=2$  and  $a_1=3$ ?

**Solution:**

□ We are looking for  $a_n$  that satisfies both recurrence and initial conditions.

□  $a_n = b_n + h_n$  where  $h_n$  is a solution for the associated homogeneous recurrence:  $h_n = h_{n-1} + h_{n-2}$

□ By previous example, we know  $h_n = \alpha_1((1+\sqrt{5})/2)^n + \alpha_2((1-\sqrt{5})/2)^n$ .

$$a_n = b_n + h_n$$

$$= -3n - 10 + \alpha_1((1+\sqrt{5})/2)^n + \alpha_2((1-\sqrt{5})/2)^n$$

□ Now we should find constants using initial conditions.

$$a_0 = -10 + \alpha_1 + \alpha_2 = 2$$

$$a_1 = -13 + \alpha_1(1+\sqrt{5})/2 + \alpha_2(1-\sqrt{5})/2 = 3$$

$$\alpha_1 = 6 + 2\sqrt{5} \qquad \alpha_2 = 6 - 2\sqrt{5}$$

So,  $a_n = -3n - 10 + (6 + 2\sqrt{5})((1+\sqrt{5})/2)^n + (6 - 2\sqrt{5})((1-\sqrt{5})/2)^n$ .

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = 2a_{n-1} - a_{n-2} + 2^n \text{ for } n \geq 2,$$

with  $a_0=1$  and  $a_1=2$ ?

**Solution:**

- Since it is linear non-homogeneous recurrence,  $b_n$  is similar to  $f(n)$

$$\text{Guess: } b_n = c2^n + d$$

$$b_n = 2b_{n-1} - b_{n-2} + 2^n$$

$$c2^n + d = 2(c2^{n-1} + d) - (c2^{n-2} + d) + 2^n$$

$$c2^n + d = c2^n + 2d - c2^{n-2} - d + 2^n$$

$$0 = (-4c + 4c - c + 4)2^{n-2} + (-d + 2d - d)$$

$$c = 4 \quad d = 0$$

- So,  $b_n = 4 \cdot 2^n$ .

( $b_n$  only satisfies the recurrence, it does not satisfy the initial conditions.)

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = 2a_{n-1} - a_{n-2} + 2^n \text{ for } n \geq 2,$$

with  $a_0=1$  and  $a_1=2$ ?

**Solution:**

- We are looking for  $a_n$  that satisfies both recurrence and initial conditions.
- $a_n = b_n + h_n$  where  $h_n$  is a solution for the associated homogeneous recurrence:  $h_n = 2h_{n-1} - h_{n-2}$ .
  - Find its characteristic equation
 
$$r^2 - 2r + 1 = 0$$

$$(r - 1)^2 = 0$$

$$r_1 = 1 \quad (\text{Its multiplicity is 2.})$$
- So, by theorem  $h_n = (\alpha_1 + \alpha_2 n)(1)^n = \alpha_1 + \alpha_2 n$  is a solution.

## EXAMPLE

What is the solution of the recurrence relation

$$a_n = 2a_{n-1} - a_{n-2} + 2^n \text{ for } n \geq 2,$$

with  $a_0=1$  and  $a_1=2$ ?

**Solution:**

- $a_n = b_n + h_n$
- $a_n = 4 \cdot 2^n + \alpha_1 + \alpha_2 n$  is a solution.
- Now we should find constants using initial conditions.

$$a_0 = 4 + \alpha_1 = 1$$

$$a_1 = 8 - \alpha_1 + \alpha_2 = 2$$

$$\alpha_1 = -3 \quad \alpha_2 = -3$$

So,  $a_n = 4 \cdot 2^n - 3n - 3$ .
